PORTAL ENHANCEMENT STRATEGY

Making the JoPACC data portal work harder for every user

A gap analysis and feature roadmap for the existing public data portal, built on JoPACC's Payment System Reports — with a focus on a new Business & Investor research experience.

363.84M

transactions across JoPACC systems in 2025

5

core payment systems covered by existing reports

0

geographic or sector dimensions currently published

SCOPE

What this analysis is built on

Yearly

End-of-Year Systems Reports, 2024–2025

Quarterly

Q3 2024 through Q2 2026

Monthly

September 2024 through August 2026

All five systems these reports cover — CliQ, JoMoPay, ACH, eFAWATEERcom and ECCU — are reflected throughout. No data outside these documents was assumed; where a recommendation depends on data not present in the reports, it is stated explicitly.

EXECUTIVE SUMMARY

The gap is not data volume. It is data framing.

The portal presents the same aggregate national figures to every visitor, regardless of whether they arrived as a curious individual, a bank product team, or a business scoping a market-entry decision.

EXECUTIVE SUMMARY

The five biggest opportunities

#	Opportunity	Why it matters	Effort
1	**User-mode selector re-filtering the existing portal**	Turns one generic dataset into four relevant experiences without collecting any new data	Low
2	**Derived-KPI layer: growth, adoption, seasonality**	These numbers already sit implicitly in the reports' narrative text; making them live turns static PDFs into an analytical tool	Low
3	**Business & Investment Insights section**	The closest existing proxy for domain research; needs careful framing so it isn't mistaken for sector GDP	High
4	**External data integration**	Required before any genuine geographic feature can exist — JoPACC's own data has no location field	Medium
5	**Cross-dataset benchmarking**	Moves the portal from "here are the numbers" to "here is how this compares" — what supports a go/no-go decision	Medium

CURRENT CAPABILITIES

Five systems already reported in depth

CliQ

Instant account-to-account transfers and purchases

Volume, value, average value; transfers vs. purchases; users by gender, age, nationality, entity type

JoMoPay

Mobile-wallet payments

Cash-in, cash-out, purchases, transfers, QR; users by wallet type and demographics

ACH

Bulk and batch transfers, including salaries

Salary vs. other types; foreign-currency transactions by USD, EUR, GBP

eFAWATEERcom

Bill-payment aggregator

Cash vs. digital split; six billing categories; new customers per year since 2014

ECCU

Cheque clearing and truncation

Cheque volume and value; returned-cheque rate and return reasons

CURRENT CAPABILITIES

Dimensions already in the data

- **Time** — monthly from Sept 2024, quarterly from Q3 2024, yearly 2024–2025
- **Transaction type** — transfer, purchase, cash-in/out, salary, per system
- **Channel** — bank account vs. wallet; on-us vs. inter-institution; counterparty type
- **Demographics** — gender, age band, nationality, individual vs. legal entity
- **Billing category** — six eFAWATEERcom categories, by volume and value
- **Currency** — JOD plus USD, EUR, GBP on ACH
- **Multi-year comparison** — most charts show 2023–2025 side by side

NOT IN THE DATA

Geography

No location field exists at any level — national totals only.

Sector

Nothing outside the six bill-payment categories: no retail, hospitality, logistics or manufacturing visibility.

GAP ANALYSIS

What a user wants to ask but cannot

Gap	Can answer today	Cannot answer today
No geographic dimension	National totals for every system and metric	Where activity is concentrated, which governorate is underserved, whether a region outpaces the national average
Coarse sector detail	Six eFAWATEERcom billing categories, bill payments only	Any market outside bill payments — retail, hospitality, logistics, manufacturing — has no visibility at all
No institution-level detail	Aggregate volumes by counterparty type	Which specific bank or PSP is gaining share — no institution is named
No benchmarking layer	Side-by-side charts for the current and prior years	Automated YoY/QoQ tables or percentile comparison against a chosen baseline
No cross-system views	Each system reported largely on its own page	A household's overall digital-payment footprint across systems combined
No user-specific views	One generic set of charts for all visitors	A default view tailored to "I am a bank" or "I am an investor scoping a market"
No self-service filtering	Pre-built charts and tables as published	Filtering by time, payment type or channel with a live recalculated view or export

USER SEGMENTATION

Three audiences, three different ceilings

A

General users

BUILDABLE NOW

Simplified summary cards, a plain-language "what changed" narrative, and a "users like me" demographic comparator.

NEEDS NEW DATA

Nothing. This is the best-served group today.

B

Banks & FIs

BUILDABLE NOW

Channel-mix dashboards, transaction-type growth leaderboards, seasonality views and national benchmarks.

NEEDS NEW DATA

Institution-level market share — the reports name counterparty types, never individual institutions.

C — primary focus

Businesses & investors

BUILDABLE NOW

Category trend and growth views for six billing categories, user-base composition, digital-adoption trajectory, seasonality.

NEEDS NEW DATA

Geographic concentration, sector coverage beyond bill payments, and any direct read on business activity or market size.

THE CENTRAL QUESTION

"Can a business or investor use the existing JoPACC data to research a specific market in Jordan before entering it?"

Partially.

And only for domains that pass through eFAWATEERcom bill payments — telecom, utilities, government services, wallets and PSPs, financial services, education.

NON-NEGOTIABLE FRAMING

Payment-system activity is not the same as economic activity in a sector

A rise in "Water & Electricity" billing transactions reflects billing and collection behaviour — not sector output or profitability.

Any feature built on this data must carry the distinction directly in the interface, not only in a methodology footnote.

NEW METRICS

Metrics computable from what is already published

YoY / QoQ growth rate

Already stated in report narratives; making it live and filterable is the highest-value, lowest-effort addition.

Digital adoption rate

Share of activity conducted digitally vs. cash. The core "is this market ready" signal for investors.

Average transaction value trend

Falling ATV with rising volume — seen across CliQ and JoMoPay in 2025 — signals a shift to everyday micro-payments.

Channel mix ratio

Bank-account vs. wallet share of instant payments — which channel is capturing new usage.

Category growth leaderboard

Turns a static "top three categories" statement into a live ranking a researcher can track.

Returned-cheque rate

A leading indicator of payment and credit stress, monitored continuously rather than read once a period.

User base composition index

Lets a business check whether a system's users match its target customer profile before committing.

Seasonality index

How far a month deviates from a system's typical pattern — informs launch, staffing and inventory timing.

Each metric carries its own stated limitation. None can be split by geography, and only billing categories approximate a sector view.

PROPOSED FEATURES

Sixteen additions, four data classes

Every feature is an addition to the existing portal. None require rebuilding it.

A Existing data, no extra processing

B Derived from existing data by calculation

C Requires external public data

D Requires new collection or partnerships

High priority — Class A / B

User-mode selector: General / Bank / Business / Investor

Auto-computed YoY / QoQ growth panel for every system

Advanced filter bar: time, system, payment type, channel

Digital-adoption index per system and per category

Business & Investment Insights dashboard, Layer 1

Category deep-dive pages for each billing category

Medium priority — Class B / C

Seasonality view and benchmark-against-national-average tool

Cross-system household footprint view

Downloadable analytical report generator

"Users like me" comparator; external-indicator overlay

Wanted most, blocked — Class D

Geographic activity map

Sector classification beyond bill payments

EXTERNAL DATA OPPORTUNITIES

Datasets that would unlock geography

Dataset	What it enables	Obtainability	Priority
Geographic boundaries	The foundational layer — required before any location analysis is possible at all	Likely available from national mapping or statistics sources	High
Population by governorate	Per-capita adoption by region — a genuine market-sizing signal	Typically published by national statistics agencies	High
Business registrations	A real sector and location view independent of payment data	Depends on whether a public registry publishes open data	High
Tourism statistics	Context for hospitality-adjacent categories and seasonality	Commonly published by national tourism authorities	Medium
Employment statistics	A cross-check on whether payment activity tracks workforce growth	Depends on agency cadence and granularity	Medium
Macroeconomic indicators	Whether payment growth outpaces, tracks or lags the wider	Generally available from	Medium

IMPLEMENTATION ROADMAP

Four phases, increasing dependency

PHASE 1

Quick wins

Existing data, low complexity

- User-mode selector
- Advanced filter bar
- Auto-computed growth panel
- Digital-adoption index

PHASE 2

Advanced analytics

Derived data, moderate complexity

- Category deep-dive pages
- Insights dashboard, Layer 1
- Seasonality and benchmarking
- Cross-system footprint view
- Report export

PHASE 3

External integration

Requires new external datasets

- Population and geographic base layer
- Per-capita adoption indicators
- Registration and tourism overlays
- Insights dashboard, Layer 2

PHASE 4

New data capture

New collection or partnerships

- Transaction-level geographic tagging
- Merchant-category tagging in CliQ and JoMoPay
- Underserved-area identification
- Institution-level benchmarking, if disclosed

RECOMMENDATION

Ship first, build next, invest long-term

Ship first

Existing data, high value, low effort

A user-mode selector that re-filters the same data into a relevant default view per audience

A live derived-metrics layer replacing narrative-only figures

An advanced filter bar so users slice data without waiting for a new chart

Build next

Derived from existing data — the core value-add

A Business & Investment Insights section with per-category deep dives, benchmarked against the national average

Cross-system and seasonality views that connect isolated per-system pages

Invest long-term

Requires data JoPACC does not hold today

Genuine geographic detail — the single most consequential gap in this analysis

Sector coverage beyond bill payments via merchant-category tagging

External economic and demographic datasets for normalised comparison

The portal's biggest untapped value lies in re-framing and deriving more from data JoPACC already has. Fully answering "should I enter this market" requires new dimensions — and that dependency should be stated plainly to stakeholders rather than implied away.
