JoPACC 2024–2025 REPORT COMPARISON

What the reports say vs. what the data can tell us

System-by-system gap analysis • 2024 vs 2025

CORE ASSESSMENT

The JoPACC reports are **data-rich but insight-light**. They present numbers accurately and describe what happened, but rarely explain why, what it means strategically, or what should happen next.

Purpose of this document

This document preserves the full comparison provided in the source material and reorganizes it for fast review. Each system separates the published report's stated insights from the additional analytical findings identified in the comparison.

Systems Summary

WHAT THE PUBLISHED REPORT SAYS

Total transactions grew +62% (224.62M → 363.84M), value grew +16.6% (JOD 79.95B → 93.26B), average transaction value fell -28% (JOD 355.9 → 256.3). The report correctly identifies that volume outpaced value growth and links it to everyday payment adoption.

WHAT THE COMPARISON IDENTIFIED

- The report treats the average value decline as a one-line observation. We identified it as a **multi-year structural trend** — this is the third consecutive year of average value decline (2023: JOD 546.5, 2024: JOD 355.9, 2025: JOD 256.3 — a -53% drop in two years). The report never flags this acceleration or asks whether it is sustainable for revenue models.
- The report never contextualises the JOD 93.26B total value against Jordan's GDP — which would be the most powerful C-level metric (payments-to-GDP ratio).
- No mention of which system drove the most growth or how the system mix is shifting.

CliQ

WHAT THE PUBLISHED REPORT SAYS

Transaction volumes doubled (+100.02%), value grew +65%, average value fell from JOD 144.1 to JOD 118.9. Notes this is the sixth consecutive year of sustained growth. Shows payment type split (82.4% transfers, 17.6% purchases) and QR totals (186.8K transactions, JOD 3.1M value). User count grew +27.3% (1.67M → 2.13M). Shows gender, nationality and age breakdown as static charts with no YoY comparison or commentary.

WHAT THE COMPARISON IDENTIFIED

- The report says transactions doubled and moves on. We identified the **depth vs breadth** story — transactions grew 4x faster than users, meaning existing users are transacting far more frequently. The report never calculates or mentions transactions per user.
- The report shows the age chart but makes **zero observation** about it — no mention that older cohorts (41+) are growing while 18-30 is saturating. This is an important signal about where growth is coming from.
- The report shows the gender split (61% male) but makes **no YoY comparison** and no comment about the gap or what it means for financial inclusion. We quantified the +1 pp Female movement and noted it is structurally insufficient.
- The report notes purchases grew as a category but never calculates **purchase share of total value** (24% in 2025 vs 17.7% in 2024 from the PDF — a significant +6.3 pp shift in one year) or identifies it as a commerce adoption signal.
- QR is presented as a standalone fact (186.8K, JOD 3.1M). The report never calculates QR as % of total purchases (0.6%) or compares to 2024 (0.4%) to show trajectory.
- The report mentions "sixth consecutive year of growth" — but never shows the full growth history or asks when growth will moderate.

JoMoPay

WHAT THE PUBLISHED REPORT SAYS

Transactions grew +79.7% (56.79M → 102.04M), value grew +21.3%, average value fell -32.5%. Purchases grew +287.4% and money transfers grew +77.2% — correctly identifies these as fastest-growing types. Withdrawals and deposits declined. Shows QR at 1.54M transactions and JOD 18.16M value. User count 2.81M. Notes female growth slowed — female share fell from 48.8% to 46.8% — and correctly attributes it to male user growth outpacing female.

WHAT THE COMPARISON IDENTIFIED

- The report notes Cash Out and Cash In declined but frames it generically as "cash remaining present within financial transactions through digital channels." We identified this as a **structural wallet transformation** — the wallet is shedding

its cash-corridor identity and becoming a spending platform. Cash Out share fell from 3.6% to 1.7% (-1.9 pp) while Purchases grew from 3.9% to 8.4% (+4.5 pp). The report presents these as separate facts; we connected them as one story.

- The report notes female share declined and attributes it to male growth being faster. We went further: **female users grew only +4.2%** (1.26M → 1.32M in absolute terms) while male users grew far faster — this is a reversal from 2024 when female users grew +23.7%. The report mentions the 2025 number but buries the contrast with 2024's strong female growth trend.
- The report shows QR at 1.54M but never computes it as % of purchases (17.9% in 2025 vs 10.8% in 2024). We identified QR adoption rate trajectory, not just the raw number.
- The report never makes the **cross-system comparison**: JoMoPay's female share (46.8%) vs CliQ's female share (36%) — a 10.8 pp gap that reveals mobile wallets are structurally more gender-inclusive than bank-linked instant payments.
- The non-Jordanian growth (+0.6 pp to 12.2%) is not mentioned anywhere in the JoMoPay section of the 2025 report. We identified it as a financial inclusion signal specific to mobile wallets.

eFAWATEERcom

WHAT THE PUBLISHED REPORT SAYS

Transactions grew +14.2%, value grew +21.2%. December was the strongest month (9.3% of annual volume). Digital share is 81.3% vs 80% in 2024. Total registered users 5.039M. Education grew fastest in volume (+25%), Wallets & PSPs grew fastest in value (+66.7%). Biller category rankings remained consistent across three years.

WHAT THE COMPARISON IDENTIFIED

- The report shows the three-year digital/cash chart (2023: 79.4%, 2024: 80%, 2025: 81.3%) but frames it as "approximately 80% digital over three years" — missing that this is a **consistent upward trend accelerating**, not a stable plateau.
- The report never mentions the **user payment type breakdown** (Digital User Only 92.1% vs 88.5% in 2024, Cash User Only 3.7% vs 6.3%) — which is the most powerful evidence that cash users are actively converting, not just being outnumbered. This data is in the report but not discussed.
- The Education anomaly — +25% transaction growth but 0% value growth — is not discussed. The report just states it grew fastest in volume. We identified the implied average transaction value decline (-20%) and the likely shift to instalment-based payments as the explanation.
- The report states "Wallets and PSPs experienced strongest growth in value (+66.7%)" with no explanation of what is driving it. We identified the **circular funding loop** — users top up JoMoPay wallets via eFAWATEERcom and then spend via JoMoPay.
- The report notes 5.039M total users but also 1.577M bank account users — a gap of 3.46M that is never explained or discussed. Who are the 3.46M users who don't pay through bank accounts? Cash agents? This is a significant data quality question the report ignores.
- December as strongest month is noted but the report never asks **why** — is it driven by year-end government payments, utility bill seasonality, or something else?

ACH

WHAT THE PUBLISHED REPORT SAYS

JOD transactions grew +7.7%, value grew +9.6%, average value JOD 823. Salary share of volume is 76.6% and value is 50.8%. Average salary JOD 545.6 (+2.1%). GBP recorded highest growth in FX value (+19%), EUR highest in volume (+7.1%). Overall FX volume grew +6.6%.

WHAT THE COMPARISON IDENTIFIED

- The report states salary share figures (76.6% volume, 50.8% value) with no comparison to 2024. We identified both as declining (-0.9 pp and -0.5 pp) — meaning non-salary ACH is growing faster than salary, a **diversification signal** the report completely missed.

- The GBP anomaly is mentioned (+19% value) but the report attributes it to a generic "increased activity in foreign currency transfers" alongside EUR and USD. We identified that **only 446 GBP transactions** produced that +19% — meaning the average GBP transaction jumped from GBP 8,070 to GBP 9,262 (+14.8%). The 2025 report flags GBP but doesn't explain the mechanism; we hypothesised UK diaspora/student tuition payments.
- The report in 2024 correctly identified USD as growing fastest in value (+14.9% that year). In 2025 the report switches to calling EUR fastest in volume — but never tracks whether USD's 2024 momentum continued or slowed. We tracked: USD volume grew +6.6% in 2025 vs +8.5% in 2024 — a slowdown worth noting.
- The report never contextualises ACH average salary (JOD 545.6) against Jordan's published average wage data or inflation — which would tell you whether purchasing power is improving or eroding.
- Three-year salary transaction data is shown visually (2023, 2024, 2025) but no growth rate trend is discussed. Salary txn count grew +6.3% in 2025 vs +6.4% in 2024 — essentially flat growth in salary payment volume, implying formal sector employment is not expanding rapidly.

ECCU

WHAT THE PUBLISHED REPORT SAYS

Cheque volume fell -3.4%, value rose +1.6%, average value rose +5.3% (JOD 6,189 → 6,515). April highest volume month, December highest value month. Returned cheques fell -7.7% in count and -26.5% in value. Return rate 3.2% volume and 2.7% value. Insufficient balance = 66.6% of returns, 64.9% of return value, average JOD 5,367.6. The report then adds a critical piece **we missed entirely**: "In June 2025, the imprisonment for debt law was abolished, contributing to a decline in returned cheques in the following months, as cheque acceptance likely decreased — particularly for higher-risk payers — following the legal change."

WHAT THE COMPARISON IDENTIFIED

- The report explains the return improvement mechanically (volume and value fell) but frames the June legal change as a footnote. We would treat it as the **primary headline** — a regulatory event (abolition of debt imprisonment law) directly caused a behavioural change in the cheque market. This is the most concrete causal insight in the entire 2025 report and it deserves front-and-centre treatment, not a bullet point at the end.
- The report notes volume and value moving in opposite directions but only in isolation. We contextualised it as part of a **multi-year digital displacement pattern** — low-value cheques migrating to CliQ and ACH while high-value institutional cheques remain.
- The report mentions December had the highest cheque value (avg JOD 6,754) vs April (avg JOD 6,315) but never explains the seasonal pattern or what drives December's high-value concentration.
- The report never mentions that ECCU's JOD 40.96B total value still represents **44% of all JoPACC system value** — making cheques the single largest value system despite the volume decline. This contextualises why ECCU still matters even as it shrinks.
- The 2024 report noted that returned cheque value **rose +10.6%** in 2024 vs 2023 — making the -26.5% fall in 2025 an even sharper reversal. The 2025 report doesn't connect these two years to show the reversal pattern.

IPS / Interoperability

WHAT THE PUBLISHED REPORT SAYS

Total IPS users reached 3.93M (+12.9%). Bank Account Only: 1.06M (27%), Mobile Wallet Only: 1.75M (45.5%), Both: 1.07M (27.1%). Monthly user growth averaged 37.4K. The report shows monthly channel split data (CliQ 62.2% of volume, JoMoPay 37.8%; CliQ 76.9% of value, JoMoPay 23.1% in December). Average IPS transaction value JOD 97.4.

WHAT THE COMPARISON IDENTIFIED

- The report shows IPS user segments by count but makes **no YoY comparison**. We identified the key dynamic: Mobile Wallet Only users fell -0.6% while Bank & Mobile Wallet users grew +28.7% — a **migration pattern** showing wallet-first users graduating into dual-channel usage. The report presents three static numbers with no movement analysis.

- The report notes average monthly user growth of 37.4K in 2025 vs 51.5K in 2024. This **slowdown in monthly growth rate** (37.4K vs 51.5K) is never flagged — the IPS user base is growing more slowly in 2025 despite the platform being larger.
- The monthly channel split table (showing CliQ% vs JoMoPay% each month) is presented as raw data with no observation. We can see from it that **JoMoPay's share of IPS volume is slowly creeping up** from 38.3% in January to 38.2% in December — essentially flat across the year, meaning JoMoPay is not gaining ground on CliQ in volume terms despite faster percentage growth.
- The report never calculates **transactions per IPS user** — which went from approximately 40 per year in 2024 to 69 per year in 2025, the strongest engagement signal in the entire dataset.
- The report never asks why IPS user growth slowed (37.4K/month vs 51.5K/month in 2024) while transaction growth accelerated. This divergence — fewer new users but far more transactions — is the most strategically important trend in the IPS section and is entirely invisible in the report.

Summary: How to Improve the Reports

Gap	What the report does	What it should do
----------	----------	----------
Causality	States what changed	Explains why it changed (legal changes, mandates, market structure)
YoY on demographics	Shows static breakdowns	Compares gender/age/nationality YoY and identifies trends
Cross-system connections	Covers each system in isolation	Links eFAWATEER bill payments → JoMoPay wallet top-ups → JoMoPay purchases
Engagement depth	Counts registered users	Calculates transactions per user to measure depth of usage
Trajectory	Reports one-year change	Shows 3-year trend direction and asks whether it will continue
Averages interpretation	Notes average values are falling	Explains what falling averages mean for revenue, adoption, and use cases
Open questions	Closes every section with facts	Should end each section with what the data cannot tell us
GDP/macro context	No external benchmarking	Should contextualise JoPACC metrics against Jordan's economy
Legal/regulatory events	Mentioned as a footnote in ECCU	Should be treated as primary explanatory variables when they exist
Migration signals	Shows static user segments	Should track movement between segments (wallet-only → dual-channel)

KEY TAKEAWAY

The biggest opportunity is not simply to add more numbers. It is to convert existing numbers into trend, relationship, engagement, causality, and decision-oriented insights—while clearly identifying what the data cannot explain.
